Well Quasi Ordering Theory

Let \mathcal{X} be a set and let " \leq " be a partial ordering relation on \mathcal{X} .

Dimitrios M. Thilikos

Department of Mathematics, UoA

Image: A math a math

Let \mathcal{X} be a set and let " \leq " be a partial ordering relation on \mathcal{X} .

Antichain: an infinite sequence on non- \leq -comparable elements.

Dimitrios M. Thilikos

Department of Mathematics, UoA

Let \mathcal{X} be a set and let " \leq " be a partial ordering relation on \mathcal{X} . Antichain: an infinite sequence on non- \leq -comparable elements. We say that \mathcal{X} is *Well-Quasi-Ordered* by \leq if it has no infinite antichain

Department of Mathematics, UoA

Let \mathcal{X} be a set and let " \leq " be a partial ordering relation on \mathcal{X} . Antichain: an infinite sequence on non- \leq -comparable elements.

We say that \mathcal{X} is *Well-Quasi-Ordered* by \leq if it has no infinite antichain

Examples:

- ▶ $2^{\mathbb{N}}$ is not W.Q.O. by set inclusion.
- ▶ \mathbb{N} is not W.Q.O. by divisibility.
- ▶ \mathbb{N}^k is W.Q.O. by by component-wise ordering.

Dimitrios M. Thilikos

Department of Mathematics, UoA

General question: Given a set ${\mathcal X}$ and an ordering relation \leq on it,

is \mathcal{X} W.Q.O. by to \leq ?

Dimitrios M. Thilikos

Department of Mathematics, UoA

メロト メロト メヨト

General question: Given a set X and an ordering relation \leq on it,

is \mathcal{X} W.Q.O. by to \leq ?

The theory of Well-quasi-ordering was first developed by

Graham Higman and Erdős & Rado

under the name "finite basis property"

Image: A math a math

General question: Given a set $\mathcal X$ and an ordering relation \leq on it,

- is \mathcal{X} W.Q.O. by to \leq ?
- The theory of Well-quasi-ordering was first developed by

Graham Higman and Erdős & Rado

under the name "finite basis property"

Remind: This talk is about graphs and algorithms!

We say that a parameterized (by k) problem belongs in the parameterized complexity class FPT if it can be solved by an FPT-algorithm, that is an algorithm that runs in

 $O(f(\mathbf{k}) \cdot n^{O(1)})$ steps

(n is the size of the input, f depends only one the parameter k.)

We say that a parameterized (by k) problem belongs in the parameterized complexity class FPT if it can be solved by an FPT-algorithm, that is an algorithm that runs in

 $O(f(\pmb{k}) \cdot n^{O(1)}) \;\; \text{steps} \;\;$

(n is the size of the input, f depends only one the parameter k.)

▶ Not all parameterized problems admit FPT-algorithms.

< D > < A > < B > <</p>

We say that a parameterized (by k) problem belongs in the parameterized complexity class FPT if it can be solved by an FPT-algorithm, that is an algorithm that runs in

 $O(f(\mathbf{k}) \cdot n^{O(1)})$ steps

(*n* is the size of the input, f depends only one the parameter k.)

▶ Not all parameterized problems admit FPT-algorithms.

There are parameterized complexity classes like W[1], W[2], or W[P] and adequate reductions such that when a problem is hard for them is not

expected to have an	FPT-algorithm

Given an instance (G, T, k) of the *k*-DISJOINT PATHS problem,

a vertex $v \in V(G)$ is an *irrelevant* vertex of G if

 (G, T, \mathbf{k}) and $(G \setminus v, T, \mathbf{k})$ are equivalent instances of the problem.

Idea: Find irrelevant vertex and recurse!

We give a outline of the idea for the case of k-DISJOINT PATHS.

Dimitrios M. Thilikos

Department of Mathematics, UoA

The general scheme of the algorithm in [GM XIII] is the following:

```
Input: An instance (G, T, k) of k-DISJOINT PATHS
Output: An equivalent instance (G, T, k) k-DISJOINT PATHS
1. while G \notin \mathcal{G}_k,
2. find an irrelevant vertex v in G
3. set G \leftarrow G \setminus v
4. output (G, T, k)
```

Dimitrios M. Thilikos

Department of Mathematics, UoA

メロト メ団ト メヨト メ

The general scheme of the algorithm in [GM XIII] is the following:

```
Input: An instance (G, T, k) of k-DISJOINT PATHS
Output: An equivalent instance (G, T, k) k-DISJOINT PATHS
1. while G \notin \mathcal{G}_k,
2. find an irrelevant vertex v in G
3. set G \leftarrow G \setminus v
4. output (G, T, k)
```

Here \mathcal{G}_k represents some structural condition for the problem input.

Dimitrios M. Thilikos

Department of Mathematics, UoA

The algorithmic scheme depends on the parameterized class \mathcal{G}_k and creates an equivalent instance that belongs in \mathcal{G}_k .

It is applied first for

$$\mathcal{G}_{k} = \{G \mid G \text{ is a } K_{h(k)} \text{-minor free graph} \}$$

and then for

$$\mathcal{G}_{\mathbf{k}} = \{ G \mid G \text{ is a } \Gamma_{j(\mathbf{k})} \text{-minor free graph} \},\$$

for some suitable choice of recursive functions $h, j : \mathbb{N} \to \mathbb{N}$.

$$\blacktriangleright$$
 Γ_r is the $(r \times r)$ -grid.

Can we make things better?

Planar graphs: By [Adler, Kolliopoulos, Krause, Lokshtanov, Saurabh, Thilikos: Tight Bounds for Linkages in Planar Graphs. ICALP 2011] it follows that $\lambda(\mathbf{k}) = 2^{O(\mathbf{k})}$.

Can we make things better?

Planar graphs: By [Adler, Kolliopoulos, Krause, Lokshtanov, Saurabh, Thilikos: Tight Bounds for Linkages in Planar Graphs. ICALP 2011] it follows that $\lambda(k) = 2^{O(k)}$.

This gives an $2^{2^{\Omega(k)}} \cdot n^3$ algorithm for the *k*-DISJOINT PATHS PROBLEM

Planar graphs: By [Adler, Kolliopoulos, Krause, Lokshtanov, Saurabh, Thilikos: Tight Bounds for Linkages in Planar Graphs. ICALP 2011] it follows that $\lambda(k) = 2^{O(k)}$.

This gives an $2^{2^{\Omega(k)}} \cdot n^3$ algorithm for the *k*-Disjoint Paths Problem

2-Limits of the irrelevant vertex technique: $2^{2^{O(k)}} n^3$ store is entired as $\lambda(k) = 2^{\Omega(k)}$

$$2^{2^{\Omega(k)}} \cdot n^3$$
 steps is optimal as $\lambda(k) = 2^{\Omega(k)}$

2-Limits of the irrelevant vertex technique: $2^{2^{O(k)}} \cdot n^3$ steps is optimal as $\lambda(k) = 2^{\Omega(k)}$

► A non-² algorithm for the *k*-DISJOINT PATHS PROBLEM (and related problems) would require radically different techniques!

Some problems

Last words on Algorithmic Graph Minors Theory...

Some recent FPT-Algorithms using the *irrelevant vertex technique* or variants of it:

- BIPARTITE CONTRACTION, PARTIAL VERTEX COVER, PARTIAL DOMINATING SET,
- TOPOLOGICAL MINOR CONTAINMENT, IMMERSION CONTAINMENT,
- Bounded Genus Contraction Containment, Odd Cycle Induced Packing,
- ODD CYCLE PACKING, INDUCED CYCLE, OPTIMAL EMBEDDING IN A SURFACE
