Discovering graph classes with Michel

Master thesis supervised by Michel Habib about 2-interval graphs

→ Reading about graph classes, learning about graph decompositions

I. PROLOGUE.

Les huit récits suivants qui relatent des événements précédant le meurtre du duc de Densmore (découvert plus d'une année trop tard) ont été recueillis par le détective Ralston de Scotland Yard auprès des huit dernières personnes à avoir vu le duc en vie (à des moments différents), à savoir :

Miss FELICIA WYNN, mannequin rencontrée par le duc à bord du *Sam Layd* au cours d'une croisière en Méditerranée

Lady CYNTHIA MANSFIELD, joueuse professionnelle au casino de Monte-Carlo

Mrs GEORGIA BLAKE, théosophe végétarienne et spirite

Miss DIANA MACLEOD, traductrice du livre de Georges PEREC

Les Closés

Miss EMILY HEALEY, lépidoptériste rousse

Miss ANN LAYBOURN, joueuse d'échecs avec un ELO à 2075

Miss BETTY TOWNSEND, pianiste

Miss HELEN GRIMSHAW, jeune comédienne ayant joué à treize ans le rôle de Zazie à Nottingham, et à seize ans celui de Vittoria dans *Le Démon Blanc* de WEBSTER

En raison de l'ancienneté des événements, ces huit personnes n'ont pu se rappeler les dates exactes de leurs séjours respectifs chez le duc, et les récits qui s'y rapportent ne figurent donc pas ici dans l'ordre chronologique.

Discovering graph classes with Michel

Master thesis supervised by Michel Habib about 2-interval graphs

→ Reading about graph classes, learning about graph decompositions

→ Obtaining results on balanced 2-interval graphs and number of arc-annotated sequences

A balanced 2-interval graph G :

A balanced 2-interval realization of G :

a vertex \leftrightarrow balanced 2-intervals
= union of 2 intervals of same length

an edge \leftrightarrow non empty intersection of the two 2-intervals

Discovering graph classes with Michel

Master thesis supervised by Michel Habib about 2-interval graphs

→ Reading about graph classes, learning about graph decompositions

→ Obtaining results on balanced 2-interval graphs and number of arc-annotated sequences

→ Understanding what is important about the obtained results

Phylogenetic trees

Phylogenetic tree of a set of species:

- Classify them depending on common characters
- Describe their evolution

classification

*Lamarck : Histoire naturelle des
animaux sans vertèbres (1815)*

Phylogenetic trees

Phylogenetic tree of a set of species:

- Classify them depending on common characters
- Describe their evolution

modelization

Woese, Kandler, Wheelis : Towards a natural system of organisms: proposal for the domains Archaea, Bacteria, and Eucarya, Proceedings of the National Academy of Sciences, 87(12), 4576–4579 (1990)

Phylogenetic trees... and networks

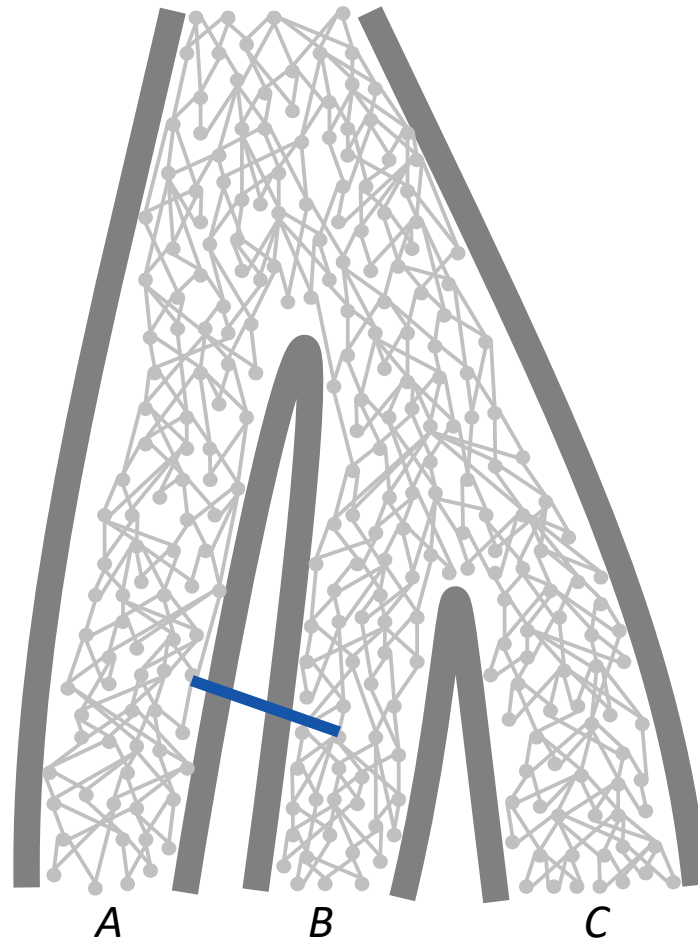

Phylogenetic tree of a set of species

Genetic material transfers

Transfers of genetic material between coexisting species:

- lateral gene transfer
- hybridization
- recombination

Genetic material transfers

Transfers of genetic material between coexisting species:

- lateral gene transfer
- hybridization
- recombination

Genetic material transfers

Transfers of genetic material between coexisting species:

- lateral gene transfer
- hybridization
- recombination

Genetic material transfers

Transfers of genetic material between coexisting species:

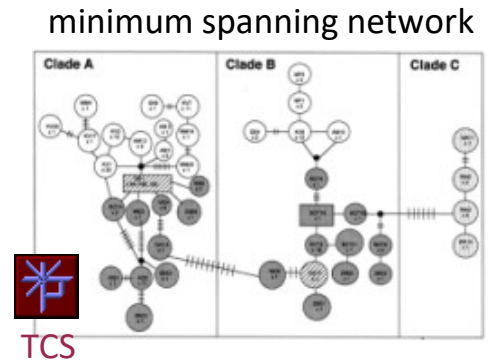

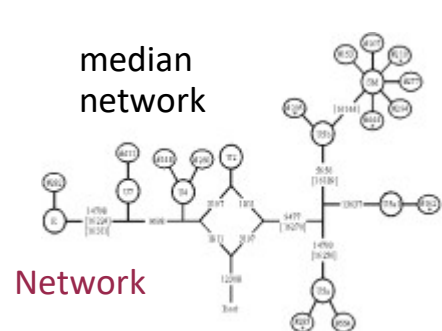

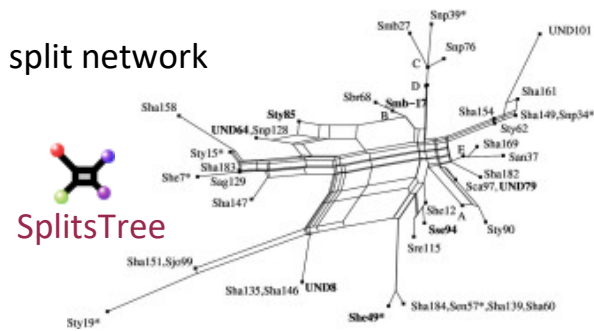

- lateral gene transfer
- hybridization
- recombination

Phylogenetic networks

Phylogenetic network: network representing evolution data

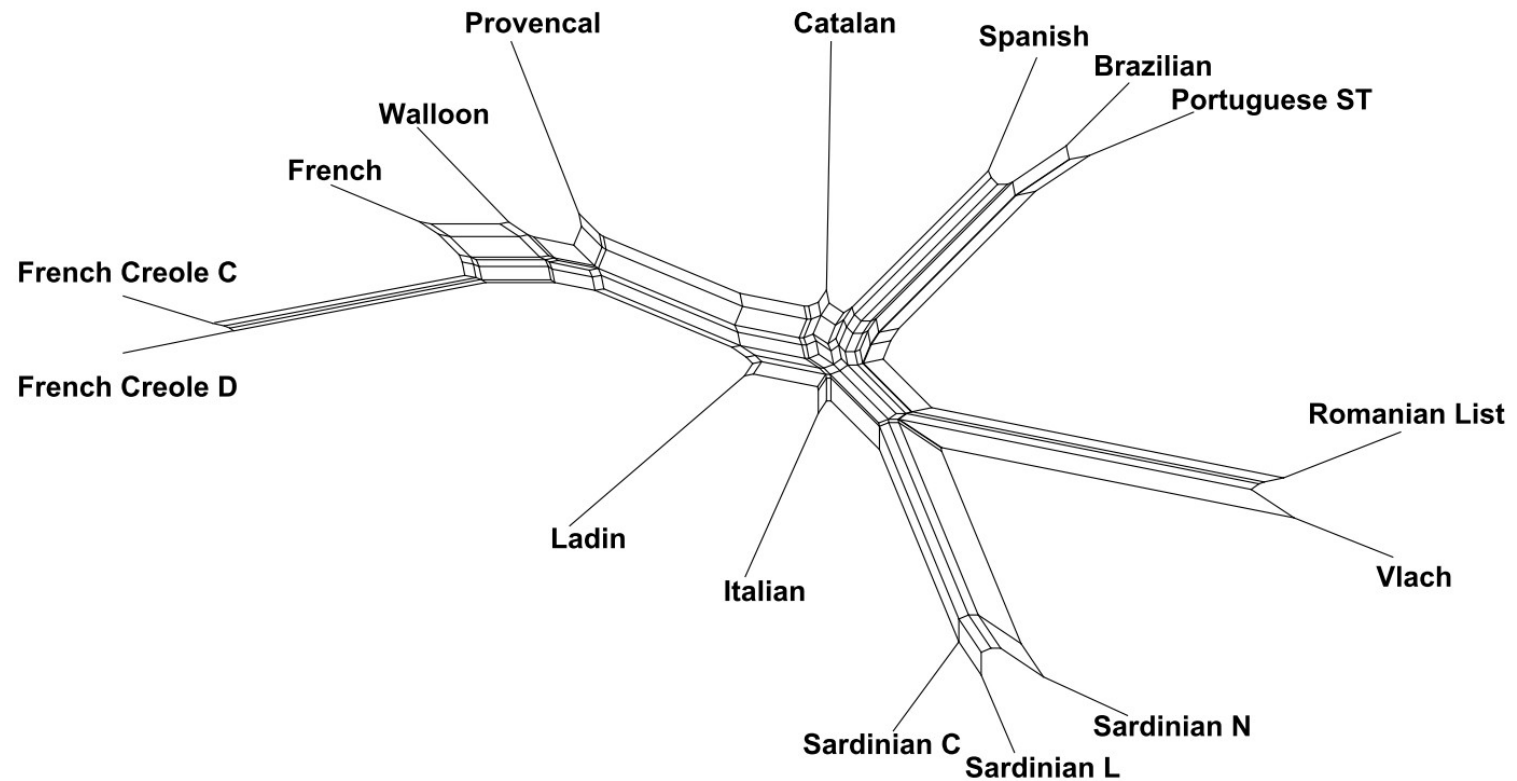

- **abstract / implicit / data-display** phylogenetic networks: to **classify, visualize data**

- **explicit** phylogenetic networks: to **model evolution**

Abstract phylogenetic networks: split networks

Willems, M., Lord, E., Laforest, L., Labelle, G., Lapointe, F.-J., Di Sciullo, A. M. & Makarek, V. (2016). Using hybridization networks to retrace the evolution of indo-european languages. BMC Evolutionary Biology, 16(1), 180.

Tree reconciliation or consensus

optimal super-network N:

- contains the input trees
- has the smallest number of reticulations

Phylogenetic network reconstruction from trees

The “**hybridization network**” problem:

given 2 trees, find the smallest network containing both of them with the minimum number of hybrid vertices

Easy to find a network containing the two trees!

T1

T2

Phylogenetic network reconstruction from trees

The “hybridization network” problem:

given 2 trees, find the smallest network containing both of them with the minimum number of hybrid vertices

Easy to find a network containing the two trees!

T_1

T_2

add a root above
the two trees, glue
the leaves together

But n hybrid vertices for trees with n leaves: not optimal!

Phylogenetic network reconstruction from trees

The “**hybridization network**” problem:

given 2 trees, find the smallest network containing both of them with the minimum number of hybrid vertices

NP-hard to minimize the number of hybrid vertices

Bordewich & Semple (2007) Discrete Appl Math

Classes of phylogenetic networks: inclusions

Classes containing this network or not

Classes which contain this network (with direct proof)

- binary genetically stable: All reticulation vertices are stable (e for leaf 2, d for leaf 1, g for leaf 3, j for leaf 4) and all have at least one parent which is stable (f , parent of d , stable for leaf 2; b , parent of e , stable for leaves 1 and 2; a , parent of g , stable for leaves 1 and 2; h , parent of j , stable for leaf 4)
- binary nearly stable: All vertices except c and i (whose unique parent is in both cases stable) are stable.
- binary level-2: Easy to check.
- binary leaf outerplanar: Easy to check.
- binary FU-stable: Easy to check.

Classes which do not contain this network (with direct proof)

- binary nearly tree-child: Reticulation vertex g is stable but none of its parents a and i have the tree-path property.
- binary nested: Easy to check.
- binary time-consistent: The redundant arc from b to e makes it impossible to build a time-consistent labeling of the vertices.
- binary galled network: Reticulation arc (c,e) is a common arc of reticulation cycles from b to e and from c to d .
- binary distinct-cluster: Vertices h and i both have the same cluster: $\{3,4\}$
- binary 1-reticulated: Tree vertex b can reach 2 reticulation vertices by 2 directed internally vertex-disjoint paths: d and e .

Classes of phylogenetic networks: inclusions

level = maximum number of reticulation vertices among all bridgeless components in the network

cluster = set of leaves below a vertex

Classes containing this network or not

Classes which contain this network (with direct proof)

- binary genetically stable: All reticulation vertices are stable (e for leaf 2, d for leaf 1, g for leaf 3, j for leaf 4) and all have at least one parent which is stable (f , parent of d , stable for leaf 2; b , parent of e , stable for leaves 1 and 2; a , parent of g , stable for leaves 1 and 2; h , parent of j , stable for leaf 4)

Classes of phylogenetic networks: new inclusions

Classes of phylogenetic networks: problems

Problems and properties studied on these classes

Problems

- **Tree Containment:** Does the input network contain the input tree on the same set of leaves?
- **Cluster Containment:** Does the input network contain the input subset of leaves as a softwired cluster?
- **Phylogenetic Network Isomorphism:** Are the two input phylogenetic networks isomorphic?

Properties

- **Upper bound on the number of vertices:** The number of vertices is bounded by the number of leaves.
- **Unbounded number of vertices:** The number of vertices is not bounded by the number of leaves.
- **Completeness for reconstruction from trees:** There exists a network in this class which displays all binary rooted phylogenetic trees on n leaves.

Database content

73 classes of phylogenetic networks including 35 classes of binary phylogenetic networks (defined in a total of 20 bibliographic references), 51 inclusion relationships proved directly between classes (including some found in a total of 9 bibliographic references), 21 networks (65 memberships to a class, 53 non-memberships to a class), 3 problems considered, 3 properties considered, 33 theorems proved directly (including some found in a total of 15 bibliographic references) including 23 positive results (which can be extended to subclasses) and 10 negative results (which can be extended to superclasses).

73 classes of phylogenetic networks including 35 classes of binary phylogenetic networks (defined in a total of 20 bibliographic references), 51 inclusion relationships proved directly between classes (including some found in a total of 9 bibliographic references), 21 networks (65 memberships to a class, 53 non-memberships to a class), 3 problems considered, 3 properties considered, 33 theorems proved directly (including some found in a total of 15 bibliographic references) including 23 positive results (which can be extended to subclasses) and 10 negative results (which can be extended to superclasses).

Problem **easy to solve** on class A \rightarrow **easy to solve** on **subclass** B
Hard to solve on class B \rightarrow **hard to solve** on **superclass** A
(similar to ISGCI)

Phylogenetic network reconstruction from trees

Recall the “**hybridization network**” problem:

given 2 trees, find the smallest network containing both of them with the minimum number of hybrid vertices

Even **checking a solution** is **hard!**

The Tree Containment Problem (T.C.P.)

Input: A binary phylogenetic network N and
a tree T over the same set of taxa.

Question: Does N display T ?

The Tree Containment Problem (T.C.P.)

Input: A binary phylogenetic network N and a tree T over the same set of taxa.

Question: Does N display T ?

→ Can we remove one incoming arc, for each vertex with >1 parent in N , such that the obtained tree is equivalent to T ?

The Tree Containment Problem (T.C.P.)

Input: A binary phylogenetic network N and a tree T over the same set of taxa.

Question: Does N display T ?

→ Can we **remove one incoming arc**, for each vertex with >1 parent in N , such that the obtained tree is equivalent to T ?

The Tree Containment Problem (T.C.P.)

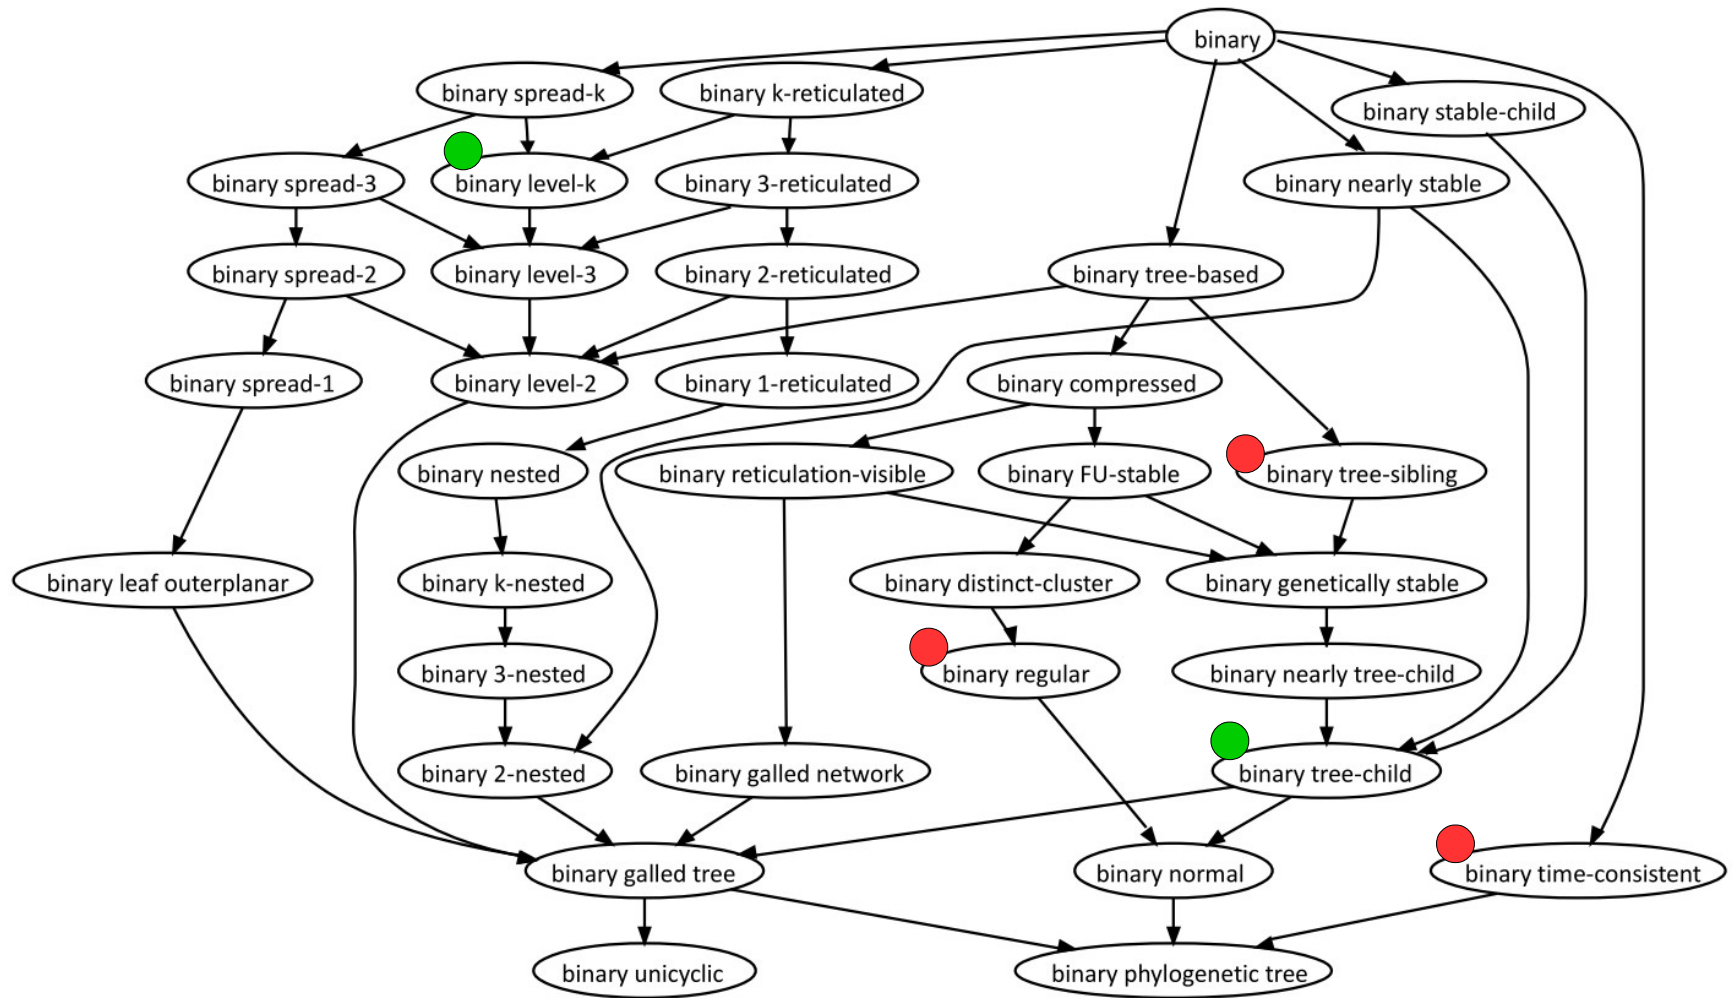

Input: A binary phylogenetic network N and a tree T over the same set of taxa.

Question: Does N display T ?

- **NP-complete** in general (Kanj, Nakhleh, Than & Xia, 2008)
- **NP-complete** for tree-sibling, time-consistent, regular networks (Iersel, Semple & Steel, 2010)
- **Polynomial-time solvable** for normal networks, for binary tree-child networks, and for level- k networks (Iersel, Semple & Steel, 2010)

Classes of phylogenetic networks and the T.C.P.

State of the art in 2011:

Classes of phylogenetic networks and the T.C.P.

State of the art in 2011:

Reticulation-visible and nearly-stable networks

A vertex u is **stable** if there exists a leaf l such that all paths from the root to l go through u .

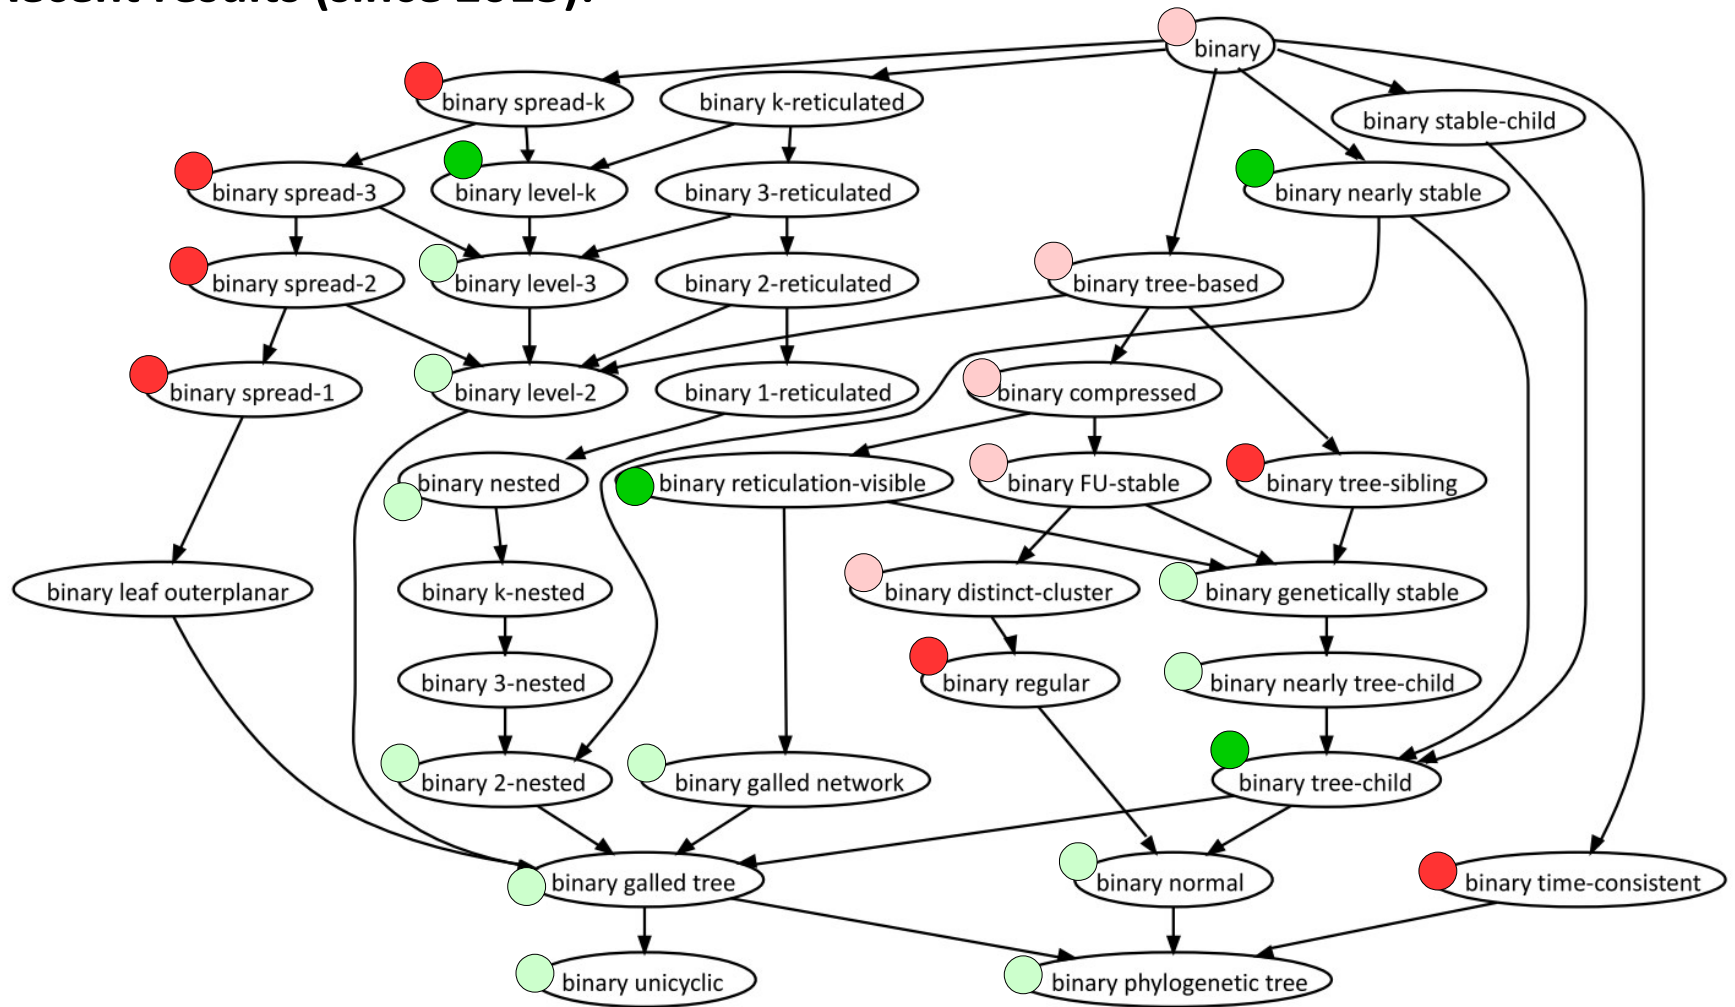

A phylogenetic network is **reticulation-visible** if every reticulation vertex is stable.

A phylogenetic network is **nearly-stable** if for each vertex, either it is stable or its parents are.

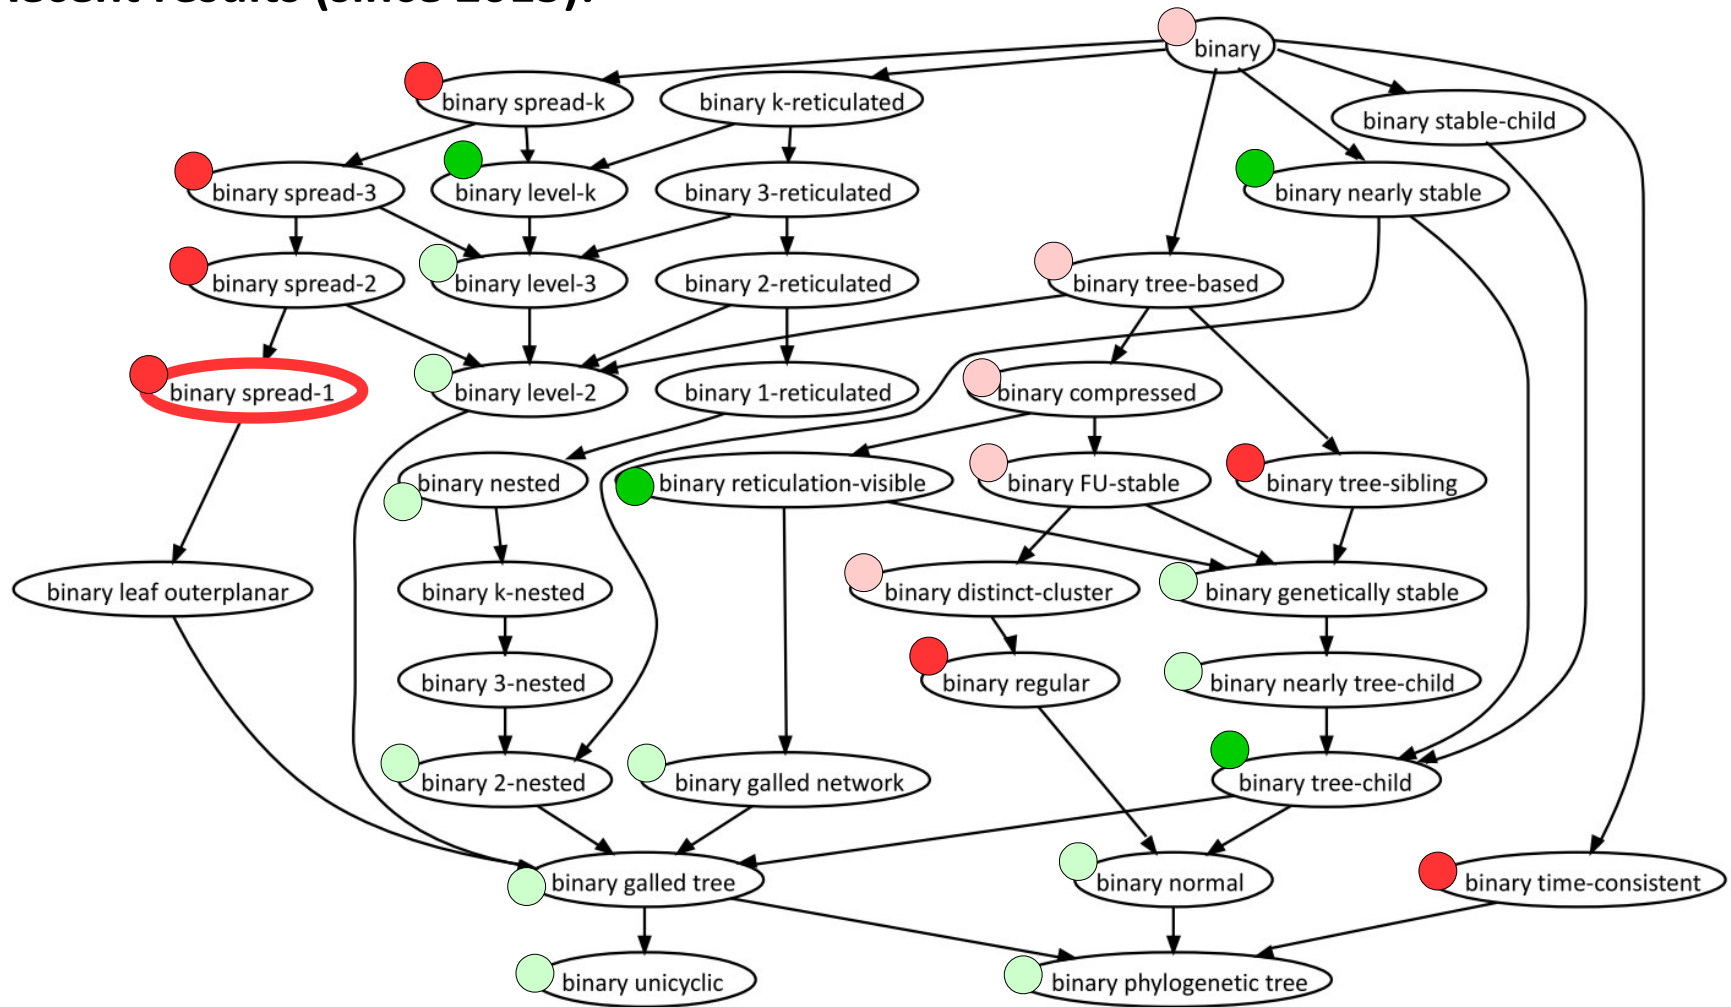

Classes of phylogenetic networks and the T.C.P.

Recent results (since 2015):

Classes of phylogenetic networks and the T.C.P.

Recent results (since 2015):

Spread-k networks: leaves can be ordered such that the set of leaves below each vertex is a union of **at most k intervals**.

Counting labeled unrooted level-1 networks

Unrooted level-1 networks:

explicit formula for n leaves, c cycles, m edges involved in the cycles.

Semple & Steel, *TCBB*, 2006

Counting labeled unrooted level-1 networks

Unrooted level-1 networks:

explicit formula for n leaves, c cycles, m edges involved in the cycles.

Pointing + bijection:

Bijection between labeled unrooted level-1 networks with $n+1$ leaves and labeled pointed level-1 networks with n leaves.

Counting labeled unrooted level-1 networks

Unrooted level-1 networks:

explicit formula for n leaves, c cycles, m edges involved in the cycles.

Pointing + bijection:

Bijection between labeled unrooted level-1 networks with $n+1$ leaves and labeled pointed level-1 networks with n leaves.

Recursive decomposition of pointed level-1 networks with n leaves:

Exponential generating function:

$$G = z + \frac{1}{2}G^2 + \frac{1}{2} \frac{G^2}{(1-G)}$$

Counting labeled unrooted level-1 networks

Unrooted level-1 networks:

explicit formula for n leaves, c cycles, m edges involved in the cycles.

Pointing + bijection:

Bijection between labeled unrooted level-1 networks with $n+1$ leaves and labeled pointed level-1 networks with n leaves.

Recursive decomposition of pointed level-1 networks with n leaves:

Exponential generating function:

$$G = z + \frac{1}{2}G^2 + \frac{1}{2} \frac{G^2}{(1-G)}$$

$\text{Seq}_{\geq 2}$, any direction

Counting labeled unrooted level-1 networks

Exponential generating function:

$$G = z + \frac{1}{2}G^2 + \frac{1}{2} \frac{G^2}{(1-G)}$$

Using the Singular Inversion Theorem (Theorem VI.6 of

$$g_n \approx 0.2074 (1.8904)^n n^{n-1}$$

):

Counting labeled unrooted level-1 networks

Exponential generating function:

$$G = z + \frac{1}{2}G^2 + \frac{1}{2} \frac{G^2}{(1-G)}$$

Using the Singular Inversion Theorem (Theorem VI.6 of

$$g_n \approx 0.2074 (1.8904)^n n^{n-1}$$

Proof :

We write $G = z \varphi(G)$, with $\varphi(z) = \frac{1}{1 - \frac{1}{2} z (1 + 1/(1-z))}$

Then $g_n \approx n! \sqrt{\frac{\varphi(\tau)}{2\varphi''(\tau)}} \frac{\rho^{-n}}{\sqrt{\pi n^3}}$, with $\rho = \tau / \varphi(\tau)$
and τ is the solution of $\varphi(z) - z\varphi'(z) = 0$

Counting labeled unrooted level-2 networks

Recursive decomposition of pointed level-2 networks with n leaves:

— Seq_{≥1}, any direction

■ Seq_{≥2}, any direction

→ Seq_{≥1}

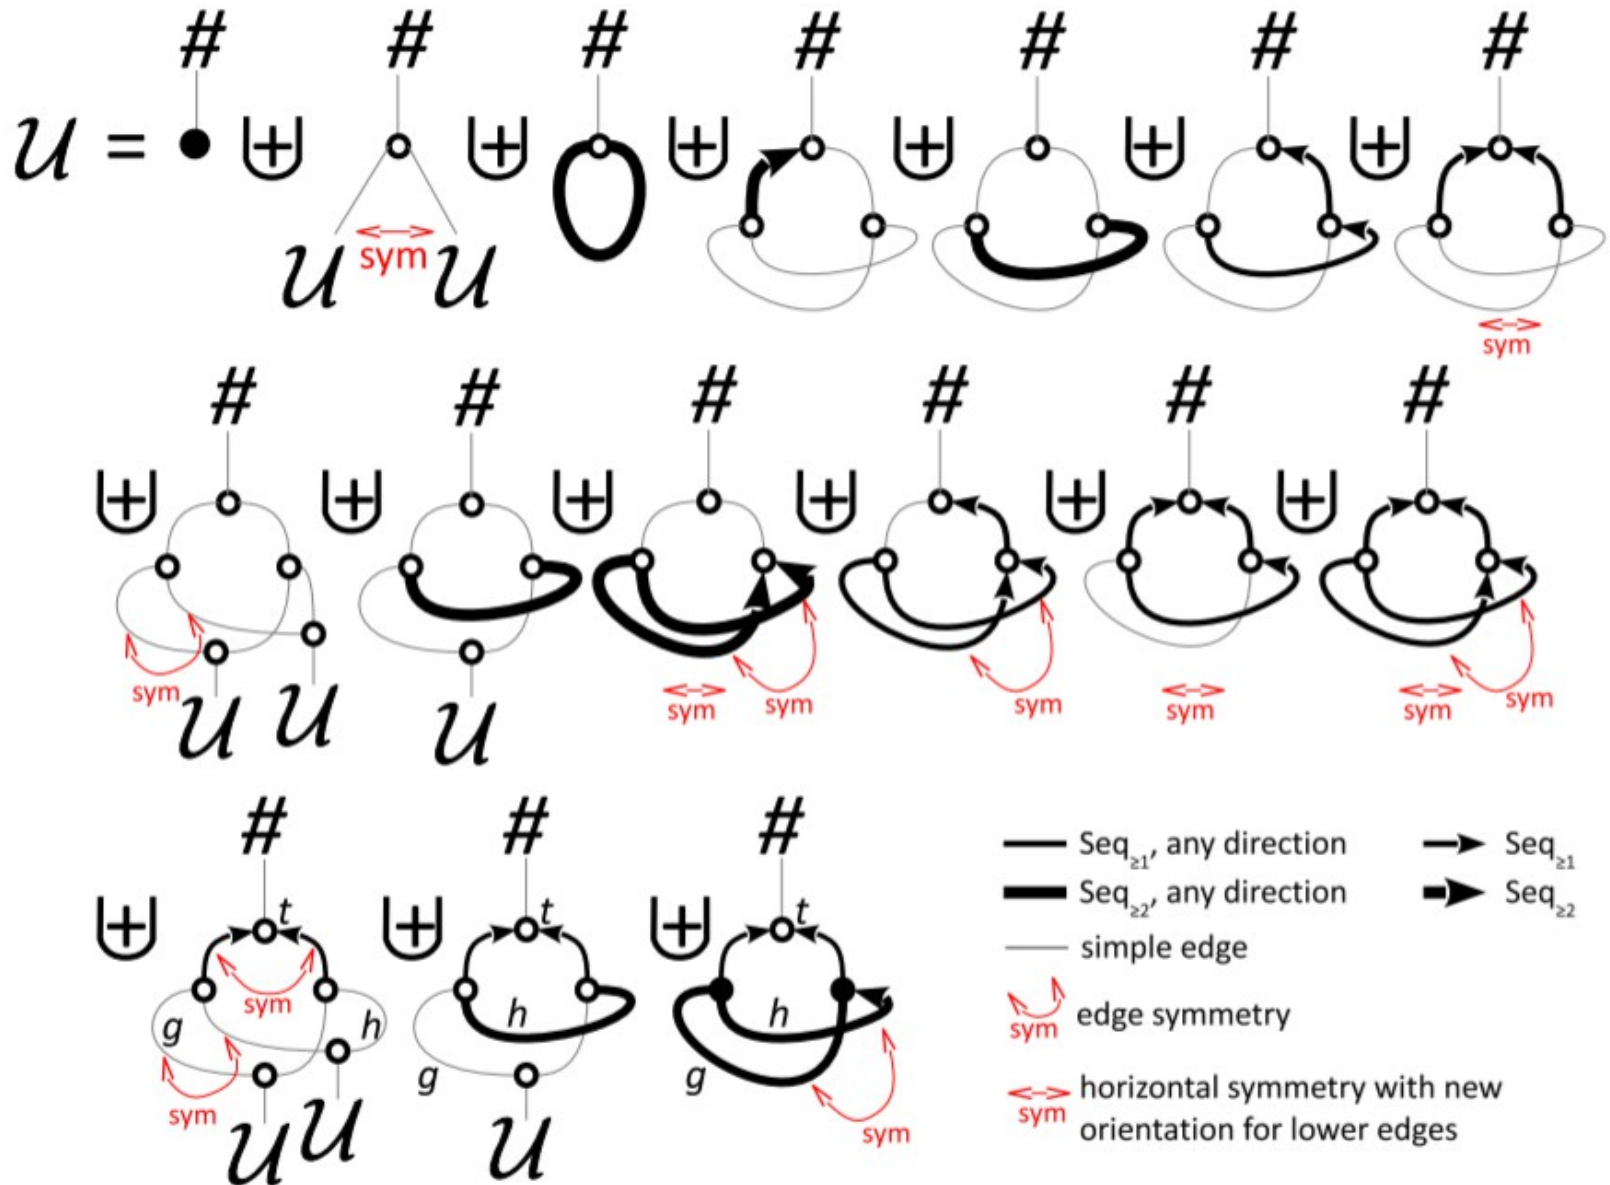

➔ Seq_{≥2}

— simple edge

 edge symmetry

 horizontal symmetry with new orientation for lower edges

Counting labeled unrooted level-2 networks

Counting labeled unrooted level-2 networks

Recursive decomposition of pointed level-2 networks with n leaves:

$$\begin{aligned} U &= z + \frac{U^2}{2} + \frac{U^2}{2(1-U)} + \frac{U^2}{1-U} + \frac{U^2}{2(1-U)} + \frac{U^2}{(1-U)^2} + \frac{U^2}{2(1-U)^2} \\ &+ \frac{U^2}{2} + \frac{U^3}{2(1-U)} + \frac{U^4}{4(1-U)^2} + \frac{U^3}{2(1-U)^3} + \frac{U^3}{2(1-U)^2} + \frac{U^4}{2(1-U)^3} \\ &+ \frac{U^4}{4(1-U)^2} + \frac{U^5}{2(1-U)^3} + \frac{U^6}{4(1-U)^4} \end{aligned}$$

Rewrite:

$$U(z) = z\phi(U(z)) \text{ where } \phi(z) = \frac{1}{1 - \frac{3z^5 - 20z^4 + 46z^3 - 46z^2 + 18z}{4(z-1)^4}}.$$

Counting labeled unrooted level-2 networks

Recursive decomposition of pointed level-2 networks with n leaves:

$$\begin{aligned}
 U &= z + \frac{U^2}{2} + \frac{U^2}{2(1-U)} + \frac{U^2}{1-U} + \frac{U^2}{2(1-U)} + \frac{U^2}{(1-U)^2} + \frac{U^2}{2(1-U)^2} \\
 &+ \frac{U^2}{2} + \frac{U^3}{2(1-U)} + \frac{U^4}{4(1-U)^2} + \frac{U^3}{2(1-U)^3} + \frac{U^3}{2(1-U)^2} + \frac{U^4}{2(1-U)^3} \\
 &+ \frac{U^4}{4(1-U)^2} + \frac{U^5}{2(1-U)^3} + \frac{U^6}{4(1-U)^4}
 \end{aligned}$$

Rewrite:

$$U(z) = z\phi(U(z)) \text{ where } \phi(z) = \frac{1}{1 - \frac{3z^5 - 20z^4 + 46z^3 - 46z^2 + 18z}{4(z-1)^4}}.$$

Lagrange inversion:

$$u_n = n![z^n]U(z) = \frac{n!}{n}[z^{n-1}]\phi^n(z)$$

Taylor expansions of $\varphi^n(z)$:

number of leaves	2	3	4	5	6	7
unrooted level-2	-	9	282	14 697	1 071 750	100 467 405

Counting labeled unrooted level-2 networks

Recursive decomposition of pointed level-2 networks with n leaves:

$$\begin{aligned}
 U &= z + \frac{U^2}{2} + \frac{U^2}{2(1-U)} + \frac{U^2}{1-U} + \frac{U^2}{2(1-U)} + \frac{U^2}{(1-U)^2} + \frac{U^2}{2(1-U)^2} \\
 &+ \frac{U^2}{2} + \frac{U^3}{2(1-U)} + \frac{U^4}{4(1-U)^2} + \frac{U^3}{2(1-U)^3} + \frac{U^3}{2(1-U)^2} + \frac{U^4}{2(1-U)^3} \\
 &+ \frac{U^4}{4(1-U)^2} + \frac{U^5}{2(1-U)^3} + \frac{U^6}{4(1-U)^4}
 \end{aligned}$$

Rewrite:

$$U(z) = z\phi(U(z)) \text{ where } \phi(z) = \frac{1}{1 - \frac{3z^5 - 20z^4 + 46z^3 - 46z^2 + 18z}{4(z-1)^4}}.$$

Lagrange inversion:

$$u_n = n![z^n]U(z) = \frac{n!}{n}[z^{n-1}]\phi^n(z)$$

Taylor expansions + Newton formula

$$u_n = (n-1)! \sum_{\substack{0 \leq s \leq q \leq p \leq k \leq i \leq n-1 \\ j = n-1-i-k-p-q-s \geq 0 \\ i \neq 0}} \binom{n+i-1}{i} \binom{4i+j-1}{j} \binom{i}{k} \binom{k}{p} \binom{p}{q} \binom{q}{s} \times \left(\frac{-3}{20}\right)^s \left(\frac{9}{2}\right)^i \left(\frac{-23}{9}\right)^k (-1)^p \left(\frac{-10}{23}\right)^q.$$

Counting labeled level- k networks

Unrooted level-1 networks:

explicit formula for n leaves, c cycles, m edges involved in the cycles

Semple & Steel, *TCBB*, 2006

+ asymptotic evaluation for n leaves: $\approx 0.207 (1.890)^n n^{n-1}$

Rooted level-1 networks :

Explicit formula for n leaves, c cycles, m edges across cycles

+ asymptotic evaluation for n leaves: $\approx 0.134 (2.943)^n n^{n-1}$

Unrooted level-2 networks :

Explicit formula for n leaves : $(n-1)! \sum_{\substack{0 \leq s \leq q \leq p \leq k \leq i \leq n-1 \\ j = n-1-i-k-p-q-s \geq 0 \\ i \neq 0}} \binom{n+i-1}{i} \binom{4i+j-1}{j} \binom{i}{k} \binom{k}{p} \binom{p}{q} \binom{q}{s} \left(\frac{-3}{20}\right)^s \left(\frac{9}{2}\right)^i \left(\frac{-23}{9}\right)^k (-1)^p \left(\frac{-10}{23}\right)^q$

number of leaves	2	3	4	5	6	7
unrooted level-1	-	2	15	192	3 450	79 740
rooted level-1	3	36	723	20 280	730 755	32 171 580
unrooted level-2	-	9	282	14 697	1 071 750	100 467 405
